

Did you leave your cushions outside in the rain again? The one thing that all outdoor products have in common is that sooner or later - if you leave them outside - they will get wet. Your chairs, sunloungers and even boats may be impervious to the elements but typically the cushions and pads are not!

Help is at hand from Dryfeel®, a different kind of comfort foam for outdoor applications where it is liable to get wet.

Dryfeel® is a load bearing foam that dries much faster because of its extremely porous cell structure. Dryfeel® is so open celled that water can just drain right through it, significantly reducing drying time, whilst retaining those all important comfort characteristics you need to relax and enjoy life outdoors. Dryfeel® is extremely well suited for applications in humid environments, such as outdoor furniture, boating cushions, camping, beach and pool cushions and mattresses,...

breathing space for the great outdoors

Recticel and Dryfeel® at a glance

I About us
Recticel Flexible Foams forms the largest business sector within Recticel, a Belgian based Group producing PU foams with a strong European dimension. Some of our famous brands include Comfort Bultex®, Sensaus®, Accadial®, FrameFoam®, Lattoflex®, Scharaflex®, Swissflex® and Epeada®.

I Dryfeel®, beauty lies within
Dryfeel has been engineered to provide a completely open cell structure, enabling water and moisture vapour to pass through it quickly and efficiently, maximising comfort for all in humid conditions. Dryfeel® is available in a range of options from Recticel and our business partners.

beauty lies
within

No more wet patches inside outdoor cushioning, only that perfect feeling of relaxation in the open air.

In a beauty contest, there can only be one winner: Dryfeel®, your perfect comfort companion in the great outdoors.

reticulated foam

not reticulated foam

inspiration for
precipitation

- wide open cells
- breathable structure
- sound comfort properties
- lasting resilience
- enhanced drying capabilities
- built-in bacteria protection
- not affected by seawater or poolwater

We have engineered Dryfeel® to have a completely open cell structure by removing the foam cell walls in a special process. The completely open passageways mean that Dryfeel® absorbs less moisture and dries much faster than traditional PU seating and bedding foams and has long lasting performance in rainy conditions and even after sea water or pool water immersion.

How do we do it?

That's our secret, but we can tell you that Dryfeel® starts out life as one of our normal comfort foams. But then we literally 'blast' open these cell walls in a special process which leaves the overall foam structure in place but transforms Dryfeel® into a completely 100% breathable product.

Dryfeel® technical properties

- Dries significantly faster compared to a traditional foam cushioning material (up to 3 times)
- Reduces the drying time of a fabricated cushion up to 50%
- Is long lasting, even after sea or pool water immersion
- Has an in-built protection against bacteria and moulds
- Holds an Oeko-Tex-100 class 1 certificate, an independently monitored standard of the human ecological aspects
- Comes in a range of soft and firm grades
